KONU 9

ATTIRE, BARE, BELT, BUTTON, CLOTHING, FOLD, GARMENT, JEWELLERY, MARK, NEAT, ORDERLY, OUTFIT, SCARF, SLEEVE, TAILOR, TROUSERS, VEIL, WEAR, WIG

Clothing is garments or dress worn by people of all cultures since prehistoric times. Fashion, until recent centuries, was the concern of the aristocracy; the clothing of ordinary people changed far less radically. In addition, the history of clothing has been reconstructed largely from portraits, generally of important people interested in recording their own importance. Thus, they were painted wearing their finest and most impressive attire.

The basic dress of the ancient Egyptians was a woven loincloth wrapped around the hips and held at the waist by a girdle or belt. For men it took the form of a skirt worn at the waist; for women it was worn over the breast and held with a strap, or took the form of a full-length garment that sometimes had sleeves.

The first recorded cold-climate garments in the Mediterranean world appeared with the invasions of the Medes in 612 BC, and the Persians in 539 BC. The Persians wore hose or trousers with an open tunic fastened by a belt. These garments were fitted and quite tight, possibly because of the small size of the hides available.

The early Romans wore a shirtlike *tunica* and the characteristic garment of Rome, the toga, which persisted as formal and ceremonial dress throughout the Republic and until the end of the Western Roman Empire. It was folded once along its length and worn draped in complicated folds. In the Roman Empire, purple became the distinguishing colour of the Senate and the emperors and subsequently became associated with European royalty. The Middle Eastern custom of veiling the faces of women originated in an Assyrian law of about 1200 BC. The traditional dress of the Ottoman Empire was a direct descendant of the styles of the ancient world, as are the classic garments of Arabs.

Indian styles of clothing were linked with caste from the earliest times. Both sexes apparently wore cloths wound around their waist, leaving their upper bodies bare. Turbans were also worn, with women favouring long headscarves and extensive jewellery. These forms of dress remained unchanged until the Muslim conquests of India in the 12th century AD.

In Europe, the catalyst for the change in clothing that marks the division between the early Middle Ages and the Romanesque period was the first of the Crusades, which began in 1095. In the 1300s the tunic was narrowed and shortened to a more tailored look and evolved into what came to be called the *doublet*. Men's clothes, on the other hand, went through the most radical change in their modern history during this period. At the beginning of the century men still wore the garments of the later Middle Ages—doublet, breeches and hose, and a cape; but during the first half of the century the *casaque* was developed for travel or military use. The fronts and backs buttoned to form a coat, and the shoulder pieces buttoned to form sleeves. An eccentricity of dress that reached its height in the following century was the wig. Powdered white or grey, large and elaborate or small and neat, the wig replaced men's natural hair at any social occasion until the French Revolution, at court functions for another 30 years after that, and in the law courts of Great Britain to this day.

In France, heading towards revolution, fashion became stiffer and more elaborate and formal. In England, on the other hand, heading towards more orderly social change and explosive industrial development, fashion reversed its normal trend.

KONU 10

1. ADDICT, ALCOHOL, BEVERAGE, CONSUME, CROPS, DIGEST, DRINK, DRUG, FOOD, NUTRITION, STUFF

Alcoholism is chronic and usually progressive illness involving the excessive inappropriate **ingestion** of ethyl alcohol, whether in the form of familiar alcoholic **beverages** or as a **constituent** of other substances. More males than females are affected by alcoholism, but **drinking** among the young and among women is increasing. **Consumption** of alcohol is apparently on the rise in the United States, as is the total alcohol consumption and **prevalence** of alcohol-related problems in the former communist countries of Eastern Europe and the former Soviet Union.

Alcoholism, as opposed to merely **excessive** or irresponsible drinking, has been thought of as a symptom of psychological or social stress or as a learned, maladaptive coping behaviour. More recently, and probably more accurately, it has come to be viewed as a complex disease in its own right. Alcoholism usually develops over a period of years. Alcohol comes to be used more as a mood-changing **drug** than as a **foodstuff** or beverage served as a part of social custom or religious ritual. Physical **addiction** to the drug may occur, sometimes eventually leading to drinking around the clock to avoid **withdrawal** symptoms.

Alcohol has direct toxic as well as **sedative** effects on the body, and failure to take care of **nutritional** and other physical needs during **prolonged** periods of excessive drinking may further complicate matters. Advanced cases often require hospitalization. The effects on major organ systems are cumulative and include a wide range of **digestive**-system disorders such as ulcers, inflammation of the pancreas, and cirrhosis of the liver. The central and peripheral nervous systems can be **permanently** damaged.

- | | |
|----------------|-----------------------------|
| 1) ingestion | a) calming |
| 2) constituent | b) component, element |
| 3) prevalence | c) consumption |
| 4) excessive | d) continued |
| 5) withdrawal | e) departure, removal |
| 6) sedative | f) extreme |
| 7) prolonged | g) forever |
| 8) permanently | h) predominance, commonness |

2. AGRICULTURE, CONSUME, DAIRY, FAMINE, FEED, FOOD, OIL, PRESERVE

Food Consumption is types of food eaten by different people in different parts of the world. For most of human history, people have depended on locally grown foods. Food storage methods were primitive, and famines were common. But in the past 100 years or so, developments in transport and in food preservation methods, such as canning and refrigeration, have made a much wider range of foods available to most people at all times of the year. In northern Europe and North America, where grass and grains (good for animal feeds) grow well, dairy products, beef, lamb, bread, and beer are still among the most popular foods, although **processed** and pre-packaged forms may now be preferred by those with limited time or preparation skills. In contrast, local wine, fruit, olive oil, and pasta continue to be widely consumed in southern Europe.

Early information on the human diet is mainly **derived** from archaeological evidence and from literature, but in the past 40 years **quantitative** information on each nation's total food supplies has been collected by the United Nations Food and Agriculture Organization. In addition, dietary differences within countries, with, for example, age, gender, region, and income in mind, are measured by many governments using surveys such as the United Kingdom's continuous National Food Survey. Differences in diet partly **account for** the wide differences in stature, health, and longevity that occur both within and between countries.

| 3) quantitative | c) obtain, acquire |
| 4) account for | d) plentifulness |
| 5) stature | e) pre-cooked |
| 6) longevity | f) size, growth |

3. FOOD, GROW, MALNUTRITION, NUTRITION, STARVE

Malnutrition is dietary condition caused by an insufficiency or excess of one or more nutrients in the diet. A person is at risk of malnutrition if the amount of energy and/or nutrients in the diet does not meet his or her nutritional needs.

Children, especially those under the age of five, suffer from the effects of starvation more quickly than adults. They develop a condition called protein-energy malnutrition (PEM). The two most common forms of PEM, *marasmus* and *kwashiorkor*, are seen in all developing countries and are life-**threatening** conditions. Marasmus occurs when a child is **weaned** early on to foods low in energy and nutrients.

Some people find it difficult to meet their nutritional requirements—some women, for example, have a very high requirement for iron which may cause them to develop anaemia if they cannot satisfy it—or have a genetic **disorder** which causes **deficiency**. Another reason for deficiency can be geographical, as in some remote areas where the soil (and therefore the plants grown) contains little iodine. As few other foods contain significant amounts of iodine, people living in these areas may suffer prolonged iodine deficiency (resulting in goitre and cretinism).

| 1) threatening | a) ailment, disease |
| 2) wean | b) lack, loss |
| 3) disorder | c) menacing, dangerous |
| 4) deficiency | d) remove from nursing |

4. ABSORB, BAKE, CHEW, CONSUME, DRAUGHT, EDIBLE, FERMENT, FOOD, FREEZE, FRUITFUL, GRAIN, GROW, INGREDIENT, JUICE, MEAL, MEAT, NUTRITION, PORK, PRESERVE, PRODUCTIVE, PROPOSE, RAW, SPREAD, STUFF, YIELD

Food Processing and Preservation are processes involved in protecting food against microbes and other **spoilage** agents to permit its future consumption. The preserved food should **retain** a palatable appearance, flavour, and texture, as well as its original nutritional value.

Micro-organisms, such as bacteria and fungi, rapidly spoil food. Enzymes, which are present in all raw foods, are catalytic substances that promote **degradation** and chemical changes affecting especially texture and flavour. Atmospheric oxygen may react with food constituents, causing **rancidity** or colour changes.

There is no single method of food preservation that provides protection against all **hazards** for an unlimited period of time. Canned food stored in Antarctica near the South Pole, for example, remained edible after 50 years. Besides canning and freezing, other traditional methods of preservation include drying, salting, and smoking. Freeze-drying is a more recent method. Among recent experimental techniques are the use of antibiotics and **exposure** of foods to nuclear radiation.

Although prehistoric humans stored meat in ice caves, the food-freezing industry is more recent in origin than the canning industry. Freezing preserves food by preventing micro-organisms from multiplying. Because the process does not kill all types of bacteria, however, those that survive reanimate in **thawing** food and often grow more rapidly than before freezing. Enzymes in the frozen state remain active, although at a reduced rate. Vegetables are **blanched** or heated in preparation for freezing to ensure enzyme inactivity and thus to avoid degradation of flavour. Blanching has also been proposed for fish, in order to kill cold-adapted bacteria on their outer surface. In the freezing of meats, various methods are used depending on the type of meat and the cut. Pork is frozen soon after butchering, but beef is hung in a cooler for several days first to **tenderize** the meat. Frozen foods have the advantage of resembling the fresh product more closely than the same food preserved by other techniques.

In one type of freezer used for packaged foods, the packages are transported mechanically on a conveyor belt through an air blast, which produces temperatures as low as -40° C (-40° F). Another type of freezer, used in the freezing of concentrated orange juice, contains a secondary refrigerant, such as calcium-chloride **brine**, as a spray or a bath for the cans at temperatures of -29° C (-20° F). In a widely used freezer called the plate freezer, the packages are in contact with hollow metal plates containing a refrigerant and are subjected to pressure in order to increase the rate of freezing. This method of preservation is the one most widely used for a great variety of foods, including bakery goods (both ready to eat, and to be cooked when desired), soups, and pre-cooked complete meals.

In food technology *drying* refers to natural **desiccation**, such as spreading fruit on racks in the sun, and *dehydration* designates drying by artificial means, such as a blast of hot air. Dehydration is preferable to canning if the product is to be stored at a high temperature. In order to achieve such protection, practically all the water must be removed. The food must then be packaged in a moisture-proof container to prevent it from absorbing water from the air.

Vegetables, fruits, meat, fish, and some other foods, the moisture content of which averages as high as 80 per cent, may be dried to one-fifth of the original weight and about one-half of the original volume. Yet, **reconstituting** the dried product may be difficult, because it absorbs only about two-thirds of its original water content; this phenomenon tends to make the texture **tough** and chewy. Drying was used by prehistoric humans to preserve many foods. In the case of meat and fish, other preservation methods, such as smoking or salting, which yielded a **palatable** product, were generally preferred.

Other methods or a combination of methods may be used to preserve foods. Salting of fish and pork has long been practised, using either dry salt or brine. Another

widely used method is smoking, which is frequently applied to preserve fish, ham, and sausage. The smoke is obtained by burning hickory or a similar wood under a low draught.

Sugar, a major ingredient of jams and jellies, is another preservative **agent**. For effective preservation, the total sugar content should make up at least 65 per cent of the weight of the final product. Fermentation caused by certain bacteria, which produce lactic acid, is the basis of preservation in sauerkraut and fermented sausage. Calcium propionate may be added to baked goods to **inhibit** mould.

Another method being studied by technologists involves the preservation of fruits and vegetables through the immediate anaerobic treatment of food stuffs with gases such as carbon dioxide, carbon monoxide, and nitrogen. Also under study is the treatment of sterilized packaged products such as milk.

Because of growing concern over the use of potentially toxic chemicals as fumigants, ionizing radiation may be used as a substitute. Irradiation delays **ripening** of fruits and vegetables; inhibits sprouting in bulbs and tubers; disinfests grain, cereal products, fresh and dried fruits, and vegetables of insects; and destroys bacteria in fresh meats.

| 17) ripen | q) whiten, bleach |

5. ADDICT, CHEW, CIGARETTE, TOBACCO

Smoking is the act of inhaling the fumes from a burning substance, usually tobacco. Smoking can be divided into two categories: active (actively smoking oneself) and passive (inhaling smoke because of **proximity** to a smoker). Cigarette smoking is the prime, but not the only, **culprit**; pipe and cigar smoking, while less hazardous than cigarette smoking, are not without risk. Smokeless tobacco (chewing tobacco, tobacco pouches, and snuff dipping) has now emerged as a major cause of oral disease and death from oral cancer.

The major **component** in tobacco is nicotine, which has a variety of effects on the sympathetic nervous system in humans. It is highly addictive—comparable to heroin and cocaine—and produces an increased heart rate; raised blood pressure; and increased **discharge** of sympathetic nerves in the autonomic nervous system.

|--------------|----------------|
| 1) proximity | a) element |
| 2) culprit | b) evildoer |
| 3) component | c) nearness |
| 4) discharge | d) performance |

6. ADDICT, BARN, CHEW, CIGARETTE, CONSUME, CROPS, CULTIVATE, DRUG, FIELD, GROW, HARVEST, SHRED, SPREAD, SWEET, TOBACCO

Tobacco is common name applied to plants of the nightshade family that are cultivated for their leaves, which, when cured, are used for smoking, chewing, and as snuff. The most widely cultivated species grows from 1 to 3 m (3 to 10 ft) tall and produces broad leaves that branch alternately from a central stalk.

Tobacco is native to the western hemisphere and was in cultivation before the European conquest of the New World. Native Americans believed it had medicinal properties and used it in ceremonies. The Arawak people of the Caribbean smoked tobacco through a tube they called a *tobago*, from which the name originated. Brought to Spain from Santo Domingo in 1556, tobacco was introduced to France the same year by the French diplomat Jean Nicot, from whom the plant derived its generic name. Tobacco use quickly spread throughout Europe and Russia, and by the 17th century it had reached China, Japan, and the west coast of Africa. In colonial America the use of tobacco began in the settlement of Jamestown as early as 1615. Tobacco is a very important crop to the economies of many countries.

Seedlings of special strains—such as those producing Maryland or burley for cigarettes, or filler, binder, and wrapper for cigars—are transplanted from cold frames to fields, each calling for special fertilizer and moisture requirements. Leaves are frequently hand-harvested in stages as they mature on the plant stem. They are hung in barns and cured by air, fire, or heat so that each tobacco type wilts, colours, and dries to impart a desired flavour.

Most tobacco is stored, for two or three years, and allowed to age before being used in tobacco products. The storage stage allows the tobacco to ferment and to take on a milder, sweeter flavour. For the manufacture of cigarettes, various sweeteners and flavourings, and glycerine are added to the tobacco before it is shredded and placed in a cigarette-making machine.

Numerous medical reports have linked tobacco smoking to lung cancer, heart and vascular disease, emphysema, and other diseases, and in consequence intense campaigns have been waged in many countries to restrict the use and marketing of tobacco. In general, tobacco consumption has been declining in the West, though in certain groups in some countries—for example, women in some parts of southern Europe—consumption has continued to rise. Tobacco also contains certain alkaloids, including nicotine, which is a mild stimulant and is considered an addictive drug. The amount of nicotine in tobacco depends on the species, the crop, and the growing conditions.
