DİLBİLGİSİ – “CLOZE TEST”

METİN 1

Christopher is not married yet; he is still --- (1). He is fond --- (2) football, which is an exciting --- (3) activity, and enjoys --- (4) a football --- (5). So most winter Saturday afternoons he puts on his old raincoat, which is badly out of --- (6) and --- (7) out of the house at five past twelve so --- (8) he can arrive early. He --- (9) the bus and --- (10) to the football ground. Even --- (11) it may be raining, he finds thousands of --- (12) already waiting in a long --- (13) outside the gates. Sometimes, if the rain is hard --- (14) to spoil the day, he watches another match on television --- (15) than going out. He likes to spend Saturday evening --- (16) through news on football matches --- (17) the back page of the newspaper. Some people like to spend the evening --- (18) in noisy clubs but Christopher prefers his comfortable and --- (19) sitting room. He feels as --- (20) he is a completely happy man until work starts again on Monday morning.

1

- A) husband
- B) partner
- C) single
- D) spouse
- E) wedded

6

- A) action
- B) mind
- C) mood
- D) reason
- E) shape

11

- A) if
- B) much
- C) plenty
- D) that
- E) when

- A) many
- B) much
- C) that
- D) if
- E) well

Metin 3

When I at last --- (1) at the town, I felt --- (2) tired that I couldn't go to --- (3) a room at once, so I went into a --- (4) restaurant to where I had parked my car and sat --- (5) at a table. A waitress was --- (6) dirty --- (7) from a meal which had probably --- (8) eaten by as --- (9) as forty people. She gave me a menu which I examined for a minute and I then --- (10) fried chicken and salad and a glass of wine. The waitress --- (11) the wine at once but I had to wait a long time --- (12) the meal --- (13). When it came, it was large --- (14) for me to assume that it was a --- (15) bird. I --- (16) a little first and it was --- (17) a delicious chicken that I ate all of it. I was now both full --- (18) relaxed and to tell the --- (19), I was not tired --- (20) more.

1

- A) arrived
- B) came
- C) drove
- D) reached
- E) rode

2

- A) enough
- B) so
- C) such
- D) too
- E) very

3

- A) accommodate
- B) check
- C) find
- D) locate
- E) stay

4

- A) concerning

Metin 7

"I'm sorry, Sir," said the bank clerk, "we can't let you --- (1) these travelers' cheques until we've entered details in your passport."

"But I've only got five hours," said Phillip, anxiously, "my plane is leaving --- (2) in the evening."

"We remain open --- (3) until three o'clock," the clerk told him.

So when Phillip was on his way to the airport --- (4) that afternoon, he asked the driver to wait outside the bank --- (5) he collected the cheques.

The plane was to leave at half-past five and the air terminal was quite far --- (6). For a time Phillip merely watched his surroundings, but shortly before --- (7) to his destination, he began checking the things he would need for boarding the plane. Tickets, money, the address of his hotel, travelers' cheques. Yes, everything --- (8) there. Just a moment, though. --- (9) about his passport? Horrified, Phillip went through his pockets. He suddenly --- (10) that he must have --- (11) his passport at the bank, though he had no memory of doing so.

Whatever could he do? It was now five past four and so there would be --- (12) little time to return to the bank, which would --- (13) be closed now. This was the first time he was representing his firm and he had an important appointment with the manager of an insurance firm in Paris at ten o'clock of the following morning. Without a passport he was --- (14) to board the plane.

--- (15) then, the taxi drew up outside the air terminal. Not knowing what to do next, Phillip got --- (16) of the car, took his suitcase and paid the --- (17). He then became aware of a good deal of confusion in the building. A voice could be heard over the loudspeaker.

"We very much regret that owing to a twenty-four-hour strike of airport staff, all flights for the rest of today had to be --- (18) off. Passengers are advised to get into touch with their travel agents or with this terminal for details of tomorrow's flights."

The voice continued to give advice and instructions. Philip breathed --- (19) with relief. He would have to let his firm about this situation but, thank goodness, he would have the good --- (20) of calling at his bank the following morning to recover his passport.

1

- A) collect

KONU 13

1. DOUBT, EDITION, EMPHASIS, LITERATE, NAME, PAMPHLET, PRINT, PUBLISH, RAISE, SCRIPT, SIGNATURE, SIGNIFY, SUPPORT, TYPE, WORD, WRITE

Printing is the name used for several processes by which words, pictures, or designs are reproduced on paper, fabrics, metal, or other suitable materials. These processes, sometimes called the graphic arts, consist essentially of making numerous identical reproductions of an original by mechanical means, and the printed book has thus been called the first mass product.

The history of printing, which by its very nature is the most thoroughly documented of any history, is practically identical with that of relief, or letterpress, printing (printing from a raised surface).

The application of signet stones is possibly the earliest known form of printing. Used in ancient times in Babylonia and elsewhere, apparently both as substitutes for signatures and as religious symbols, the devices consisted of seals and stamps for making impressions in clay, or of stones with designs cut or scratched on the surface.

The elaboration of printing from the simple stamping or signet-stone method to the process of printing on a printing press apparently occurred independently at different times in different parts of the world. Books copied by hand in ink applied with pen or brush were a significant feature of the Egyptian, Greek, and Roman civilizations. Such handwritten books were also produced in medieval monasteries and were greatly valued. In ancient Rome, commercial book publishers issued editions comprising as many as 5,000 copies of such illuminated manuscripts as the epigrams of the Roman poet Martial. This copying work was done by literate slaves.

The principles involved in printing had been used by European textile workers, in printing designs on cloth, for at least a century before printing on paper was invented. The art of papermaking, introduced into the West in the 12th century, spread throughout Europe in the 13th and 14th centuries. By the mid-15th century paper was available in abundance. During the Renaissance, the rise of a prosperous and literate middle class increased the demand for quantities of reading matter. The rise of Martin Luther and of the Reformation and the subsequent religious wars were heavily dependent on the printing press and on the steady stream of printed pamphlets.

Johann Gutenberg, of Mainz in Germany, is traditionally considered the inventor of Western printing. The date associated with the invention is 1450. Both Dutch and French historians of printing have attributed the invention to people in their own countries and have produced considerable supporting evidence. The books of the first Mainz printer, however, particularly the book known as the Gutenberg Bible, far surpass in beauty and artisanship all the books that reputedly preceded them. Gutenberg's great accomplishment undoubtedly contributed decisively to the immediate acceptance of the printed book as a substitute for the handwritten or manuscript book. Books printed before 1501 are said to belong to the incunabula era of printing.

Up to the 19th century many beautiful typefaces were created and presswork was perfected. Around 1800, however, developments in printing began to emphasize increased speed. Charles, 3rd earl of Stanhope, introduced the first printing press made entirely of steel. In 1803, in London, the brothers Henry and Sealy Fourdrinier installed their first papermaking machine; they produced a continuous roll of paper, satisfying a steadily increasing demand. Then, in 1814 the steam-driven printing press was invented by Friedrich König, and the whole printing industry was revolutionized.

2. ADOPT, ALPHABET, ANNOUNCE, BROADCAST, CALL, COMMAND, COMMUNICATION, CRY, DEMAND, EXPRESS, GESTURE, INFORM, INQUIRE, INSCRIBE, LETTER, MANUSCRIPT, MEANING, MESSAGE, NEWS, PRINT, RECEIVE, RECORD, REPEAT, SHEET, SIGN, SPEECH, SYMBOLIZE, TRANSMIT, WARN, WORD, WRITE

Communication is the process of transmitting and receiving ideas, information, and messages. The rapid transmission of information over long distances and ready access to information have become **conspicuous** and important features of human society, especially in the past 150 years, and in the past two decades, increasingly so.

Communication between two people is an **outgrowth** of methods developed over centuries of expression. Gestures, the development of language, and the necessity to engage in joint action all played a part.

Charles Darwin pointed up the importance of communication and expressiveness in biological survival. Recent studies have dealt with the range of animal communication. For example, when bees discover a source of nectar, they reveal its location to the other bees on returning to the hive. They communicate the distance to the source by means of a dance; the direction is **indicated** by the angle of the axis of the dance, and the amount of nectar by the **vigorousness** of the dance. Scientists have recorded and identified birdcalls for courting, mating, hunger, food bearing, territoriality, warning, and distress. Research into the behaviour of whales and dolphins has revealed that they have relatively elaborate vocal signals and that they communicate over long distances underwater.

The origin of language is subject to considerable speculation. Some words may be **imitative** of natural sounds. Others may have come from expressions of emotion, such as laughter or crying. Language, some theorists believe, is an outgrowth of group activities, such as working together or dancing. Another theory holds that language developed from basic sounds that accompanied gestures.

Early peoples sought the means by which to record language. They drew and painted on cave walls to **convey** messages and they used signs and symbols to **designate** tribe or ownership. As human knowledge expanded, writing became necessary in order to transmit information. The earliest writing was pictographic, with symbols representing objects. The first pictographic writing was cuneiform, by which wedge-shaped characters were inscribed with a stylus on a clay tablet. Cuneiform later developed ideographic elements; the symbol came to represent not only the object but also ideas and qualities associated with it.

Writing, however, continued to convey only the meaning, not the sound, of words. Eventually, cuneiform incorporated phonetic elements, that is, signs that represented certain sounds. Egyptian hieroglyphs **underwent** a similar development. This system progressed from pictograms to ideograms; it incorporated signs for consonants, but it never developed into an alphabet. The alphabet, invented in the Middle East, was carried by the Phoenicians to Greece, where vowel sounds were added

to it. The Cyrillic alphabet was adapted from the Greek; the Latin alphabet developed in countries farther to the west where the Roman culture was dominant.

The Egyptians discovered that a kind of writing material could be made from strips of the stem of the papyrus plant. A later discovery was parchment, which was made by preparing both sides of a sheet of animal tissue for writing uses. Meanwhile in China, about 105 AD, the method of papermaking was discovered. It took over 1,000 years for the technique to travel to Europe, and it came at a time when a great demand for books began to appear. In the middle of the 15th century the German printer Johann Gutenberg used moveable type for the first time in Europe to print the Bible. This technique expanded the opportunities for learning and led to radical changes in the way people lived. It **contributed** to the growth of individualism, the Reformation, rationalism, scientific inquiry, and regional literatures that reflected the rise of nationalism. News sheets called corantos began to appear in Europe in the 17th century. At first devoted to trade and other business news, they eventually developed into the first true newspapers and magazines providing the dissemination of current information to the public at large.

Over the centuries people have also sought means for communicating more rapidly over long distances than conventional modes of transport would allow. Early methods included drumbeats, fire, smoke signals, and instruments such as a ram's horn. In time, bugle calls and drums came to play an important role in communicating military commands. During the Middle Ages, homing pigeons were used to **transmit** messages. In the early 1790s, Claude Chappe, a French scientist and engineer, began the construction of a system of semaphore stations, a visual telegraph capable of sending a message many kilometres in a few minutes. Some of these tall towers, similar to later rail semaphore towers, were as far as 32 km (20 mi) apart. The system was copied in Britain and the United States. Such semaphore systems, which variously used telescopes and sun-reflecting mirrors, remained slow because each signal had to be repeated at each station to **verify** the accuracy of transmission.

With the beginnings of modern understanding of the phenomenon of electricity in the 18th century, inventors started to search for ways in which electrical signals might be employed for the rapid **relay** of messages over long distances. The first practical telegraph system, however, was not produced until the 19th century, when two such inventions were announced in the same year of 1837: one, in Britain, by Charles Wheatstone and William F. Cooke, and the other, in America, by Samuel F. B. Morse. Morse also developed the code system of dots and dashes—Morse code—that was universally adopted for the new medium. Various refinements appeared in later decades. For example, in 1874 Thomas Edison developed quadruplex telegraphy, by which two messages could be transmitted simultaneously in two directions. Modern offshoots of telegraphy are seen in teletype, telex, and facsimile transmission.

Although telegraphy marked a great advance in rapid long-distance communication, early telegraph systems could convey messages only letter by letter. The search was therefore also on for some means of voice communication by electricity as well. Early **devices** that appeared in the 1850s and 1860s were capable of transmitting sound vibrations but not true human speech. The first person to patent an electric telephone in the modern sense was the American inventor Alexander Graham Bell, in 1876. At the same time, Edison was also in the process of finding a way to record and then reproduce sound waves, paving the way for the invention of the record player. The theory of the electromagnetic nature of light was advanced by the British physicist James Clerk Maxwell in 1873 in his *Treatise on Electricity and Magnetism*. The theories of Maxwell were **validated** by the German physicist Heinrich Rudolf Hertz. In 1887 Hertz discovered electromagnetic waves, thus laying the technical foundation for wireless telegraphy. During the following decade, much experimentation was conducted with the sending of wireless signals. In 1896, the Italian inventor Marchese Guglielmo Marconi transmitted a wireless signal from Penarth to Weston-super-Mare in England, and in 1901 sent a wireless signal across the Atlantic Ocean, from Cornwall. The vacuum tube with two elements was invented by the British physicist John Ambrose Fleming in 1904. A valuable improvement was made a few years later by the American inventor Lee De

Forest, who invented a three-element vacuum tube that provided the basis for many electronic devices. The first radio broadcast was made in 1906, in the United States. The first broadcast of opera, from the Metropolitan Opera House in New York was transmitted by De Forest in 1910. By 1920 several radio stations began transmitting in the United States, and by 1923 the British Broadcasting Corporation (BBC) was transmitting in the United Kingdom; by 1925 there were 600 radio stations worldwide. Nowadays almost every home in Britain and other countries has a radio.

Early manuscripts were illuminated with intricately drawn pictures. In the late 15th century woodcuts for illustrations came into use in printed books. At the end of the 18th century lithography was invented, permitting the mass reproduction of artwork. In 1826, using sensitized metal plates exposed for eight hours, the French physicist Joseph Nicéphore Niepce produced the world's first photograph. Building on Niepce's work, the French painter and inventor Louis Jacques Mandé Daguerre discovered a chemical developing process that permitted a greatly reduced exposure time, producing the photograph known as the daguerreotype. As the 19th century progressed, various methods were devised to give photographs and photography the illusion of motion. In 1891 Edison patented the kinetoscope, a machine for projecting moving pictures that he had first demonstrated in 1889. In 1895 the French chemist and industrialist Louis Jean Lumière and his brother Auguste Marie Lumière, also a chemist, demonstrated and patented the cinematograph, which successfully projected moving pictures. In the late 1920s sound was added to films.

The system of transmitting moving images has many roots. One is the invention of a scanning disc by the German television pioneer Paul Gottlieb Nipkow in 1884. Another landmark in the development of television was the invention in 1923 by the Russian-American electronics engineer Vladimir Kosma Zworykin of the iconoscope for transmitting and the kinescope for receiving images over a distance. In 1926 John Logie Baird used this system to demonstrate the first electrical transmission of moving images. This stimulated further developments in the United States, Britain, and Germany. In Britain, the BBC began television broadcasts in 1927, using Baird's system, and by 1937 had begun the world's first high-quality public broadcasting service.

One of the most dramatic advances in communication potential—data communications—is found in the field of computer technology. Since the first development of the modern electronic digital computers in the 1940s, computerization has infiltrated almost every area of society in nations with advanced technology.

KONU 14

1. CONTEXT, GRAMMAR, LANGUAGE, STILL, TERM, THUS, TRANSLATE

Grammar is branch of linguistics dealing with the form and structure of words (morphology), and their interrelation in sentences (syntax). The study of grammar reveals how language works.

Language-specific prescriptive grammar is only one way to look at word and sentence formation in language. Some grammarians seek to establish the differences or similarities in words and word order in various languages. Thus, specialists in comparative grammar study sound and meaning correspondences among languages to determine their relationship to one another. By looking at similar forms in related languages, grammarians can discover how different languages may have influenced one another. Still other grammarians investigate how words and word order are used in social contexts to get messages across; this is called functional grammar.

The study of grammar began with the ancient Greeks, who engaged in philosophical speculation about languages and described language structure. This grammatical tradition was passed on to the Romans, who translated the Greek names for the parts of speech and grammatical endings into Latin; many of these terms (nominative, accusative, dative) are still found in modern grammars. But the Greeks and Romans were unable to determine how languages are related. This problem spurred the development of comparative grammar, which became the dominant approach to linguistic science in the 19th century.

2. ACCENT, ACCOUNT, ALTHOUGH, COLLOQUIAL, CONTEXT, GRAMMAR, JARGON, LANGUAGE, NEVERTHELESS, NONETHELESS, PERSONAL, RHETORICAL, SLANG, STILL, SUBJECT, TERM, TEXT, THROUGH, THUS, TONGUE, TRANSLATE

Language use is the concern of scholars in many fields, among them literature, communications, speech and rhetoric, sociology, political science, and psychology. Language structure is the concern of linguistics. Within the field of linguistics the definitions of language vary, and linguists differ in approach according to the definition they use. Those who study language as written communication are interested in the structure of what they call "text"—how sentences and their parts are organized into coherent wholes—and concerned with how one language can be accurately translated into another. In the field of machine translation, computers handle the vast amount of data needed for such studies. Comparative linguists seek to identify families of languages descended from a common ancestor.

It seems clear that many species communicate; human as distinct from animal communication, however, has been characterized by some scholars as unique in having the following seven features: (1) Human languages have separate, interrelated systems of grammar and of sound and gesture. (2) They allow new things to be communicated all the time. (3) Humans make a distinction between the content that is communicated and their labels for that content. (4) In human communication, spoken language is interchangeable with language that is heard. (5) Human languages are used for special purposes; intent lies behind what is communicated. (6) What is communicated can refer to the past and the future. (7) Human language is learned by children from adults and is passed down from generation to generation.

Some convincing recent research in teaching American Sign Language (AMESLAN) to primates indicates, however, that a number of these features may not be uniquely human. Nonetheless, it seems safe to say that although language as a system of communication is not uniquely human, human language nevertheless has unique

characteristics. Humans **string** together **discrete** signs and units of grammar to form an **infinite** set of never-before heard, thought, read, or signed sentences. Infants who have not yet been taught grammar form their own rules of language by using their linguistic ability together with input from the speech community into which they are born.

In speech, an airstream is produced by the lungs and **modulated** by vibration (or lack of vibration) of the vocal cords and by movement of the tongue, the soft palate, and the lips. The airstream can be **obstructed** in varying degrees by the teeth and can be closed off from or kept open to the nasal cavity. People who have physiological impairments of speech and hearing still possess language, although the production and reception of language may have been transferred to visual systems such as AMESLAN.

Languages can be classified by the form of their grammar. Beginning in the 19th century, linguists attempted to group the world's languages into four morphological, or typological, categories (that is, categories based on how words are formed): analytic, agglutinative, inflectional, and incorporating. Analytic languages typically have words of one **syllable** with no affixes, or added parts; words are on their own, isolated, as in Chinese. In agglutinative (from the Latin for "to glue to") languages, words are composed of roots, or basic parts, and one or more affixes (prefixes at the beginning, infixes in the middle, and suffixes at the end of words) with distinct meanings. An example is Turkish, which has *äv* ("house"), *ävdä* ("in the house"), *ävlär* ("houses"), and *ävlärda* ("in the houses"). In inflectional languages, the basic and added parts have **merged**, and the added parts have no independent meaning. For example, in Latin, which is inflectional, the subject's person and number are reflected in the form of the verb, as in *fero* ("I bear"), *ferimus* ("we bear"), and *ferent* ("they bear"). An incorporating language is one in which objects, indirect objects, and other sentence elements are incorporated into the verb as one word. Swahili does this, as in *hatukuviwanunulia*, which means "We did not buy them (= things) for them (= people)". The components of this word are *ha* (negative), *tu* ("we"), *ku* (indicator of past), *vi* ("them", meaning "objects"), *wa* ("them", meaning "people"), and *nunulia* ("buy for").

The Indo-European family is only one of several dozen families and proposed larger groupings. Linguists differ in their approach to classification, and what a conservative scholar may term a family, another more liberal scholar may consider a subfamily within a larger grouping. Conservative scholars, on the other hand, may consider that too little **evidence** exists to support such larger groupings.

The written form of a language is static, unchanging, reflecting the form of the language at the time the alphabet, syllabary, or character system was adopted. Unlike speech, writing may ignore pitch and stress, **omit** vowels, or include punctuation and capitalization. The written and spoken forms of a language also differ in that writing does not incorporate spoken dialect differences. Speakers of mutually unintelligible Chinese dialects, for example, can read one another's writing even though they cannot communicate through speech.

The written form of a language may have more prestige than the spoken form, and it also may have a more complex grammar and a distinctive vocabulary. A standard written literary language thus **tends** to influence the speech of educated people. In Arabic-speaking countries, for example, educated people sometimes use classical Arabic in speech as well as in writing, whereas uneducated people speak only colloquial Arabic. A standard language is that one of the language's dialects that has become dominant. Few people actually speak such a standard language; rather, they **approximate** it with their own regional variations. The standard dialect is the one that is used when a language is taught to nonnative speakers; the learners then speak it, but do so with an accent, or variation carried over from their first language and region.

People who have activities in common or share a profession or trade may have a special "language" called an argot that identifies them as distinct from outsiders. Teenagers, thieves, and prostitutes have an argot separating them from parents, police, and other authorities. Such a specialized informal argot is called slang. An argot or specialized terminology, as shared by members of a profession, without any **connotation** of slang, is called a jargon.

Sometimes rapid language change occurs as a result of contact between people who each speak a different language. In such **circumstances** a pidgin may arise. Pidgins have relatively small sound systems, reduced vocabularies, and simplified and altered grammars, and they rely heavily on context in order to be understood.

No human language utilizes any sounds that cannot be produced by any human being, or any grammatical categories that cannot be learned by any human—whether or not the native language of a given person makes use of those sounds and structures. The **range** of possible language changes, in other words, seems to be limited by the universal structural properties of language.
